

Hospital Evansville, Indiana

AquaMaster & BoilerPlex Installation

OVERVIEW:

Customer sought to deliver well water at 400 GPM as backup to city water, and as feed water for its boilers and cooling towers. Due to exceptionally high iron content and hardness, however, the well water was unusable and required specialized treatment.

ACCOMPLISHMENTS:

Our special engineering system effectively removed the iron, and the patented CWI magnetic scale control unit fully treated water hardness; part of our AquaMaster system. We also installed the BoilerPlex™, on the Hospital's steam boilers, enabling chemical free scale control, precise and automated oxygen scavenger feed, steam lined treatment, and automated blow down.
